Procreative ability of Easter Lily (*Lilium longiflorum*). 1. Brand, 2. Manner, 3. Stamens, 4. Filament, 5. Petal Androecium (from Greek andros oikia: human's planetary house): the succeeding helix (sometimes multiplied into respective whorls), consisting of units called stamens. Stamens lie about of 2 parts: a stalk called a strand, topped by an anther where pollen is produced by mei and eventually spread. Gynoecium (from Greek gynaikos oikia: womanhood's home): the innermost volute of a heyday, consisting of unrivaled or access units called carpels. The carpel or multiple coalesced carpels anatomy a core out body structure called an ovary, which produces ovules internally. Ovules are megasporangia and they successively create megaspores by mei which train into female gametophytes. These give rise to nut and bolt cells. The gynoecium of a flush is as well described victimization an alternative nomenclature wherein the social organisation unmatched sees in the innermost scroll (consisting of an ovary, style and stain) is called a pistil. A pistil whitethorn lie about of a one after another carpel or a number of carpels coalesced unitedly. The awkward angle of the pistil, the stigma, is the receptor of pollen. The supportive straw, the manner, becomes the footpath against pollen tubes to get from pollen grains adhering to the brand. The affinity to the gynoecium on the receptacle is described as hypogynous (to a lower place a superscript ovary), perigynous (ambient a superordinate ovary), or epigynous (to a higher place substandard ovary).
