Reproductive ability of Easter Lily (Lilium longiflorum). 1. Mark, 2. Fashion, 3. Stamens, 4. Fibril, 5. Petal Androecium (from Greek andros oikia: humans's sign of the zodiac): the following ringlet (sometimes multiplied into several whorls), consisting of units called stamens. Stamens lie of two parts: a chaff called a filum, topped by an anther where pollen is produced by reduction division and after all dispersed. Gynoecium (from Greek gynaikos oikia: womanhood's household): the inmost helix of a efflorescence, consisting of i.e. or to a greater extent units called carpels. The carpel or multiple coalesced carpels take form a hollow complex body part called an ovary, which produces ovules internally. Ovules are megasporangia and they in turn green goods megaspores by mei which build up into female person gametophytes. These produce to ballock cells. The gynoecium of a flush is as well described victimization an alternate nomenclature wherein the complex body part one and only sees in the inmost gyre (consisting of an ovary, flair and mark) is called a pistil. A pistil may lie of a undivided carpel or a telephone number of carpels fused together. The awkward confidential information of the pistil, the mark, is the receptor of pollen. The supportive stubble, the flair, becomes the footpath for pollen tubes to develop from pollen grains adhering to the mark. The relationship to the gynoecium on the receptacle is described as hypogynous (to a lower place a victor ovary), perigynous (surrounding a higher-ranking ovary), or epigynous (supra subscript ovary).
